New Plan Editing Modes:

- **Review** allows the information for the current plan to be reviewed.
- **Correct** allows minor text changes within the current Plan.
- **Revise** allows any entry to be changed, but does not require a complete plan re-evaluation.
- **Reevaluate** begins the process for conducting the required, periodic, complete plan re-evaluation
- **New Leaks** allows new leak repair and other trending data to be entered and stored in SHRIMP
- **Edit** is an additional Revision Mode that is chosen automatically by SHRIMP when there is no prior data available for comparison.

Concept of “Plan Year”

- **Plan Year** refers to the most recent year’s leak repair, locate ticket and other data used in the eight threat assessments
- You can enter leak repair and other data into SHRIMP but not use it in threat assessments until required by the periodic plan re-evaluation period specified in your written plan (up to 5 years)
- For example, you can enter 2010 and 2011 leak repair data in SHRIMP, but if you keep the Plan Year at 2009, the 2010 and 2011 data will not be considered in SHRIMP’s trend analyses
